Is this a "Fast & Focused" Search Request? (Circle One) (YES)   NO

A "Fast & Focused" Search is completed in 2-3 hours (maximum). The search must be on a very specific topic and meet certain criteria. The criteria are posted in EIC3600 and on the EIC3600 NPL Web Page at _139697_
http://ptoweb/patents/stic/stic-tc3600.htm.

What is the topic, novelty, motivation, utility, or other specific details defining the desired focus of this search? Please include the concepts, synonyms, keywords, acronyms, definitions, strategies, and anything else that helps to describe the topic. Please attach a copy of the abstract, background, brief summary, pertinent claims and any citations of relevant art you have found.

STIC Searcher _____   Phone _____

Date picked up _____   Date Completed_____

What is claimed is:

1. A method of ordering a part for a xerographic apparatus comprising:

monitoring electronically a condition of a replaceable part in a first device, the replaceable part having: a first condition upon installation; at least one intermediate condition after use; and a third condition when a replacement part is substantially necessary; and

electronically sending a signal to a second device, the signal automatically electronically offering to purchase a replaceable part upon identification of at least one of the first condition, second condition, and third condition in the replaceable part using an electronic signature.

2. The method of **claim 1** further comprising predicting a condition of the part prior to the electronically sending the signal.

3. The method of **claim 2** further comprising receiving electronically an acceptance of the offer to purchase the replaceable part.

4. The method of **claim 2** further comprising installing the replaceable part prior to occurrence of the third condition.

5. The method of **claim 1** further comprising delivering the replaceable part to the first device when monitoring indicates the condition of the part is between about the first condition and the third condition.

6. The method of **claim 3** further comprising providing information relating to the signal to at least one of a user, a supplier, and a third party.

7.   The method of **claim 6** wherein the information relates to at least one of: (1) a present condition of the part; (2) a prediction of a future condition of the part; (3) an inquiry; and (4) an offer to purchase.

8.   The method of **claim 1** further comprising:

using a sensor and software system to perform monitoring and predicting of a condition of the part.

9.   The method of **claim 1** wherein at least one of the first device as the second device are interactive.

10.   The method of **claim 1** further comprising:

displaying a purchase order screen, the purchase order screen including data relating to the part; and

sending the data electronically to a supplier of the part.

11.   The method of **claim 10** further comprising:

sending data to the supplier after a user enters data.

12.   The method of **claim 6** wherein the information further relates to at least one of: (1) present supply of a consumable; (2) wear of a consumable; (3) usage of the part; (4) rate of depletion of a consumable; (5) rate of wear of the consumable; (5) predicted date of depletion of the consumable; (5) a predicted date of need of a consumable; (6) delivery schedule of a consumable; and (5) statistical data relating to a part.

13.   The method of **claim 1** further comprising:

launching a communications link to access a URL address, the URL address defined by a condition of the part.

14.   A method of ordering a part for an apparatus comprising:

identifying electronically a condition in an apparatus; and

automatically launching an electronic communications to initiate at least one of an inquiry and an offer to purchase to a supplier based on the condition.

15.   A method of ordering a part for a marking device comprising:

sensing a condition at a consumable part in the marking device, the marking device adapted to at least one of identify and predict a code indicative of a threshold of a consumable; and

launching an electronic communication to access a computer at an address defined by the condition for ordering a replacement for the consumable part.

16.   The method of ordering a part of **claim 15** wherein the consumable part is functionally associated with a sensor and software system to sense and predict a condition in the device and to electronically communicate information, the sensor and software system including logic adapted to initiate a purchase order defined by the condition.

Bell & Howell Selects emWare to Internet-Enable Its Copiscan 8000 Series Scanners.
PR Newswire, p0795
May 3, 1999
TEXT:
 Remote, Web-Based Access and Control of Scanners Reduces Hardware Development
        and Support Costs for Bell & Howell, and Improves Ease-Of-Use for Customers
        SALT LAKE CITY, May 3 /PRNewswire/ -- emWare(R), Inc., the leading provider of distributed networking software for 8- and 16-bit embedded devices, today announced that Bell & Howell (NYSE: BHW) is implementing emWare's EMIT(R) (Embedded Micro Internetworking Technology(TM)) for its Copiscan(R) 8000 Series line of scanners. The technology enables scanners to be networked, allowing users to access, control and manage their scanners using a Web browser over an intranet or the Internet. By augmenting the interface at the scanner with a web-based, PC-remote interface, local administrators can more effectively manage a scanner's status, usage and access archived data. In addition, IS managers will be able to assign unique IP sub-addresses to EMIT-enabled scanners, allowing Bell & Howell's service providers to improve their customer service, while reducing the cost of service.
        "emWare's EMIT technology helped establish our leadership in the growing demand for Internet-enabled scanners," said Price Hodson, vice president of engineering at Bell & Howell's Imaging Components business unit. "For example, using EMIT software, we were able to develop an embedded scanner that can be remotely managed via a Web browser with a user interface for a customer in less than two weeks. This rapid development allowed us to serve our customers' unique needs, providing them with financial savings and improving their efficiency."
        With Web-based, remote access, users can now monitor their scanners using their Web browser instead of having to walk up to each device. For users in organizations with multiple scanners in various locations, checking status, usage and whether a scanner is operating properly has become as simple as clicking on their Web-browser. These local administrators also benefit from the easily viewed information afforded by a Web-based graphical interface.
        "Companies are looking to technology to help increase profitability. emWare's solution means a significant savings for Bell & Howell on the cost of developing the hardware for their scanner interfaces," said Scott Raban, vice president of marketing for emWare. "In addition, Bell & Howell will show an additional return on investment by being able to do remote diagnostics and support for its emWare-enabled scanners."
        Service and support for the scanners have also been enhanced. Bell & Howell's remote service centers can be notified immediately in the event an emWare-enabled scanner needs repair, enabling them to act more quickly and efficiently to shorten or eliminate downtime for a customer's scanners. In organizations where daily operations depend on fully functional scanners, this rapid response greatly impacts company profits.
        EMIT Implementation for Bell & Howell
        emWare's EMIT distributed networking architecture is playing a role in helping Bell & Howell reduce development time and money, and improve administration of its scanners. EMIT includes emMicro(TM), a device object server requiring minimal microcontroller resources from each networked device (scanner) while providing the necessary intelligence to communicate to the company's network. In the Bell & Howell implementation, emMicro

requires only 2K of memory on each scanner. emMicro's small footprint made it possible to leverage the 8-bit microcontroller already built into the Copiscan 8000 Series scanner while still adding network access and control.

emMicro works in conjunction with emGateway(TM), which provides the link between lightweight device communications (RS232, RS485, I2C, etc.) and networks, including intranets and the Internet. emGateway includes the necessary Internet standards, such as HTTP, Java, and TCP/IP, without putting excessive memory requirements at the device. emGateway can reside on a PC, single-board computer, or on an Internet Service Provider (ISP).

Two other elements of emWare's EMIT technology contributed to Bell & Howell's solution, saving significant development and design costs. emNet(TM) -- a serial-based messaging protocol -- enabled Bell & Howell to utilize an existing, spare port on their scanners, eliminating the need to re-engineer their scanner to accomplish device networking. emObjects(TM) -- Java objects used to create intuitive, full-featured user interfaces created with drag-and- drop simplicity using Symantec's Visual Cafe(TM) -- saved development time, allowing Bell & Howell to complete their prototype in less than two weeks.

The Web browser interface developed by Bell & Howell enables scanner information to be displayed in tables and graphs to show status, paper supply, **usage** , **toner** / **ink** supply, etc. If a **scanner** is broken, alarms are triggered by emMicro, communicated to emGateway, and displayed in the browser interface or sent as a **page** or e-mail to Bell & Howell's **service** personnel.

About Bell & Howell

Bell & Howell Company (NYSE: BHW), headquartered in Skokie, Ill., is a leading information solutions and services provider to industries worldwide. In each of its businesses, the company transforms information through software and services, helping its customers operate more effectively and efficiently.

For customers in paper-intensive industries -- such as banking, insurance, health care, legal services, transportation and government -- Bell & Howell is a leading provider of imaging components for information capture. The company develops and markets a complete line of document scanners that transform information contained on paper into digital images. All Bell & Howell products are backed by a global network of knowledgeable service technicians. For more information on Bell & Howell's Imaging Components business (formerly Bell & Howell Scanner Division), call 800-SCAN-494, or visit www.bhscanners.com. Additional information on Bell & Howell Company can be found at www.bellhowell.com.

About emWare

emWare is the leading provider of a distributed embedded device networking software that provides networking and Internet connectivity for any device, including those with 8- and 16-bit microcontrollers, without requiring an RTOS or a TCP/IP stack at the device. The company develops products based on open Internet standards that allow embedded device manufacturers to simplify the use, management and networking of their products. emWare is the founder of the Embed The Internet (ETI) Alliance (www.emware.com/eti) which promotes emWare's vision to provide complete solutions for connecting any device through any network with any interface or application. emWare, Inc. is based in Salt Lake City, Utah. For more information about emWare and its products, please visit www.emware.com.

ABSTRACT

PROBLEM TO BE SOLVED: To grasp a condition of a machine such as a construction vehicle to perform **service** for the machine timely in accordance with it further easily.

SOLUTION: A vehicle **monitoring** system 1 **monitors** the latest **condition** of remote vehicles 17 to provide a web **page** on which **monitoring** results (current position, failure **part** , remaining time of consumption part, etc.), are displayed to client systems 7, 9, 13 intermittently on line. **Link** data or control data for connecting with a part management system 3 and a rental system 5 are buried in the web page. The client systems 7, 9, 13 display the web page indicating the monitoring results and then are connected with the part management system 3 to retrieve parts and order the purchase of parts on line by utilizing the link data or the control data buried in the web page or are connected with the rental system 5 to retrieve a substitute vehicle and perform rental order on line.

ABSTRACT

PROBLEM TO BE SOLVED: To distribute a processing load come up from the conditional retrieval of an inspection result database in **order** not to give the influence on another user who retrieves the condition of the inspection result database on a Web **site** .

SOLUTION: Registered conditional retrieval request data are periodically **monitored** by a **condition** extracting processing **part** 5 in a Web server 2. When a request to be processed exists, a conditional extracting processing is performed from the inspection result database 6 is requested time sequential order and, then, the processing result is reflected in a conditional retrieval database 4.

ABSTRACT
PURPOSE: To provide the method and the device for optimizing a compiler which can generate the purpose program of high execution efficiency by eliminating a useless comparing instruction.
CONSTITUTION: A loop invariable parameter judgement part 1 detects the existence of the comparing instruction to compare a loop invariable parameter with a constant or with the other loop invariable parameter and the existence of a condition branching instruction related to this comparing instruction in the loop. Corresponding to the loop invariable parameter detected by the loop invariable parameter judgement part 1, a register setting instruction generation part 2 generates an instruction train to store a branching destination **address** in a register just before the loop. A comparing/branching instruction **replacement** **part** 3 **replaces** the comparing instruction **detected** by the loop invariable parameter judgement **part** 1 and the **condition** branching instruction with a no-condition branching instruction corresponding to the **address** in the register set by the instruction train generated by the register setting instruction generation part 2.

             November 15, 1989 (19891115)

ABSTRACT
PURPOSE: To speedily transmit the trouble spot of a transmitting path to a
terminal station by causing the **service** bit of an **address**, which
corresponds to the internal its own station of an **address** outputted from
an additional information generating **part**, to be an alarm **detecting**
condition in an input and output **part** where the interruption of an
input line is generated.

CONSTITUTION: A repeating station is provided with input and output parts 1
and 2 to insert supervising information to the **service** bit, which
corresponds to the **address** of its own station, an alarm **detecting** **part**
3 to **detect** an input line interrupting **condition** from the outputs of
the respective input and output parts 1 and 2 and an additional information
generating part 4 to generate the same **address** information and **service**
bit as a transmitting side terminal station when the line interrupting
condition is **detected**. In the input and output **part** when the input
line interruption is generated, the **service** bit of the **address**, which
corresponds to the internal its own station of the **address** outputted from
the additional information generating **part** 4, is caused to be the alarm
detecting **condition** and the signal of frame constitution is sent to a
following station.

ABSTRACT
PURPOSE: To attain the designation of an editing block by calculating a
square area shown by the maximum/minimum values of the X and Y coordinates

of plural detected touch positions and designating it roughly on a transparent touch panel.

CONSTITUTION: A transparent touch panel 4A is constructed to provide a touch panel group on a matrix as shown in a circle. A sampling circuit 6 always samples cyclically a switch and a touch coordinates **detecting part** 7 investigates the turn on/off **condition** of the switch. At the time of turn-on, (x) and (y) component data of the coordinates are **addressed** on registers (x) and (y). A CPU 2 calculates the coordinates of two points of a diagonal position in **order** to specify a minimum square including all plural touch coordinates. The document data of a memory 3 corresponding to the square area is stored into an auxiliary memory 8 as a moving object document.

Abstract (Basic): US 20030147400 A1
     NOVELTY - The method involves determining topology information (214) and traffic demands (212) comprising requested amount of traffic between source node (210) and destination node (218) for one of several service classes (220). A solution which specifies a network path for each demand is determined form objective function which is determined using topology information and traffic demands.
     DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:
     (1) server; and
     (2) traffic routing program
     USE - For routing traffic over networks in telecommunication system.
     ADVANTAGE - Optimizes the path selection for multiple **service** classes in network. Enhances uniform distribution of traffic among **links** , thus providing more efficient **use** **of** network resources. Effectively **detects** the **component** failure of network and automatic recalculation off network path in response to failure.
     DESCRIPTION OF DRAWING(S) - The figure shows a schematic view of the optimization server.

JP 2001253145 A   10 B41J-029/38

Abstract (Basic): JP 2001253145 A
       NOVELTY - The original page data is stored in a memory, based on
    which printing order is determined by a detector. A controller (10)
    sets the printing conditions for the page data, based on determined
    printing order. A printer prints the page data on the recording medium,
    based on set printing conditions.
       USE - For managing color/monochrome printing modes of printer.
       ADVANTAGE - Shortens printing time, by eliminating unnecessary
    modification of printing conditions.
       DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of
    the printing management apparatus. (Drawing includes non-English
    language text).

AU 200137641 A   G01N-033/00   Based on patent WO 200167093

Abstract (Basic): GB 2360095 A
      NOVELTY - A chemical sensor array system comprises a chemical
    sensor array apparatus and network connection for communicating with
    the apparatus from a remote location.
      USE - As laboratory instruments and can also be used for, e.g. in
    quality control applications or manufacturing processes.
      ADVANTAGE - The inventive system enables data and information to be
    uploaded to the apparatus form a remote site, and provides effective
    real-time access to the apparatus for 24 hours a data from a remote
    site(s). The apparatus may be located inaccessible, hazardous or
    hostile locations but may be interrogated at a remote more convenient
    location without the need for a **service** engineer or user to visit the
    apparatus. The invention enables sensor data or other information to be
    transmitted to a central monitoring **site** and also permits information
    to be sent back to the **apparatus** . **Use** **of** the invention provides
    internet connectivity to the sensors and **monitoring** **site** through a
    telephone network including a mobile telephone network. The invention
    gives a cost saving through the reduction of on-site visits. The
    manufacturer can be also upload software upgrades to the apparatus with
    no need for posting or delivering of actual media or for the user of
    the apparatus at the installation site.

JP 2001124771 A   7 G01N-033/543

Abstract (Basic): JP 2001124771 A
        NOVELTY - A detector for immunochromatography comprising a test
    substance application site to which a liquid substance is applied, a
    labeling specific. bond substance containing site and a detecting part
    which detects the labeling specific bond substance formed on a porous
    carrier, where an analysis target object is fixed to the detecting
    part, is new.
        DETAILED DESCRIPTION - The test substance application site,
    labeling specific bond substance containing site and detecting part are
    arranged in **order** towards downstream side from upstream side on the
    porous carrier. The labeling specific bond substance containing **site**
    moves towards the **detecting** **part** under wet **conditions** .
        USE - The detector is useful for detecting an analysis target
    object by immunochromatography.
        ADVANTAGE - Analysis target object, preferably low molecular weight
    substances such as a hapten which are unsuitable for a sandwich method
    can be detected using the detector. The detection is simple.
        DESCRIPTION OF DRAWING(S) - The figure shows the side view of the
    detector.

Abstract (Basic): EP 1085441 A2
      NOVELTY - A part is ordered for a peripheral device in a computer
    system by sensing the condition of the peripheral and automatically
    launching a communications browser to access a server at an **address**
    defined by the sensed condition. The server provides the browser with a
    purchase   order screen for an appropriate **replacement   part** for
    the peripheral. The **condition   sensed** may relate to a consumable
    reaching a use threshold indicating imminent **replacement** is required.
    The user enters personal data and the browser and server automatically
    add the information to the purchase screen to order the necessary part.
      DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for
      (a) a computing machine
      (b) a computer readable medium carrying instructions to control a
    computing machine.
      USE - In data processing systems and networks.
      ADVANTAGE - Automatic provision of help reduces the need for costly
    manned help lines.

Abstract (Basic): DE 19832070 A
      A method of controlling electronic or electrical equipment and
    devices via a telecommunication network, including at least one mobile

part which together with a base station, can receive control
information via the local radio channel and/or via the cellular radio
network.
At least one peripheral electronic device is connected to the power
supply terminal via the loading station with the condition of the
peripheral device being monitored automatically and transmitted to the
mobile **part** e.g. cordless handset when abnormal operating **conditions**
are **detected** , followed by the control information and commands in
order to disconnect, or set up, the **link** between the device and the
power supply terminal.
USE - For cordless telephones operating via ISDN-network.

Abstract (Basic): JP 11085500 A
NOVELTY - A standard time acquisition unit (3) acquires standard
time information. An usage term monitoring unit (4) compares acquired
standard time with the usage term (8) of an application program, and
starting of an application program is prohibited in the case of
expiration during starting of application program. DETAILED DESCRIPTION
- When performing the application program with the usage term,
communication starting is applied to communication unit (5), and a
standard time information providing site (6) is made to access in an
application program usage term management apparatus (1). INDEPENDENT
CLAIMS are also included for the following: an application program
usage term management procedure; an application program usage term
management program
USE - In PC.
ADVANTAGE - Inaccurate usage of application with usage term is

prevented by limiting the duration of **service** to a fixed period.
DESCRIPTION OF DRAWING(S) - The figure shows functional block diagram
of application program usage term management **apparatus** . (1)
Management **apparatus** ; (3) Standard time acquisition unit; (4) **Usage**

Abstract (Basic): JP 10294707 A
    The method involves connecting a failure notification medium (11)
between a lower **order** apparatus (12) and a higher **order** apparatus
(10). The lower **order** apparatus is connected with the medium through
a set of up and down HW **links** (21,22). Whenever a **monitoring**
pattern stoppage **condition** is experienced by the lower **order**
apparatus ,the corresponding communication failure is notified to the
higher **order** apparatus by the notification medium according to the
interruption produced in the up link or down link, by carrying out a
logical `OR' operation.
    ADVANTAGE - Facilitates notification of hardware and software
failure to higher order apparatus, collectively.

RD 346035   A   .2 G06K-000/00

Abstract (Basic): RD 346035 A
      The colour printer enhancements include special set up arrangements
concerned with a customer-preferred tone-production curve or certain
degree of sharpness enhancement. A facility to store logo or signature
in memory for insertion at a desired location, coupled with securing
coding if required is provided. Colour slide and negative recognition
is achieved in scan input either via a bar coded slide negative or from
background negative information, such as slide colour.
      Colour separation from monochrome high resolution proofing can be
recombined into full colour output. Printing out of test charts in the
LRP and rescan aids recalibration of its own system. Auto-black
detection, increases the throughput rate by going from black printing
with a neutral **page** with 3 colour printing in a neutral **page** .
Colour toner balance using different levels of gray **component
replacement** (GCR) to optimise **toner   usage** based on data from
toner   monitor .
      USE/ADVANTAGE - For silver halide or thermal transfer type printer.
Enhances the use of a colour printer to suit many customer user
requirements.

...addition, the Model C40D's developer and photoconductor are
self-tracking and tell users when **replacement** is needed via an
alphanumeric display. This self- **tracking** greatly simplifies **printer**
management.
OPTIONAL HIGH-CAPACITY **ACCESSORIES**
     The Model C40D's standard input and output paper capacities are
800 and 550 **pages** , respectively. Optional high-capacity input and
output accessories increase input capacities to 3,050 sheets...
